

Introducing PASS Release 5.14

PASS Release 5.14 further enriches PASS functionality and improves the procurement process.

Here are the highlights:

New Module

ACM - Ariba Category Management

ACM is the project management tool for contracting staff to efficiently manage a sourcing project.

ACM helps OCP source more strategically by enabling OCP buyers to collaborate, gain greater visibility, and capture category knowledge for re-use.

It helps teams make better decisions, increase buy-in, compliance, and efficiency by providing workspaces for process and knowledge management.

OCP Project Initiation eForm

A new eForm has been added to PASS, the OCP Project Initiation Form (oPIF).

Requisition

When creating a modification, some requisitions were affected by an error message that stated “the ship to address cannot be changed,” even though no changes were made to the ship to address. The error should no longer appear as the bug has been fixed.

ePIF

The System Administrator will no longer appear in the ePIF approval flow when an approver has the “no supervisor” role.

Reports

The PASS User report, which can be run by the agency security officer, will now include PASS users who have the “No Supervisor” role.

eSourcing

A delete button has been enabled in the eSourcing vendor invitation listing after the 100 vendors are selected. The specialist is able to delete the vendors from the invitation list.
